## **Listing of Claims:**

1. (Original) A memory interface system, comprising:

at least one channel line that couples a memory to a memory controller, the at least one channel line being responsive to a terminal voltage that is independent of a memory supply voltage and a memory controller supply voltage.

- 2. (Original) The memory interface system of Claim 1, wherein the memory comprises a first transmitter and a first receiver, the memory controller comprises a second transmitter and a second receiver, and the at least one channel line comprises a first channel line that couples the first transmitter to the second receiver and a second channel line that couples the second transmitter to the first receiver.
- 3. (Original) The memory interface system of Claim 2, wherein the first and second receivers are powered by the memory supply voltage and the memory controller supply voltage, respectively.
- 4. (Original) The memory interface system of Claim 3, wherein the first and second transmitters are operable independent from the memory supply voltage and the memory controller supply voltage, respectively.
- 5. (Original) The memory interface system of Claim 2, further comprising: a first level shifter circuit that couples the second channel line to the first receiver; and a second level shifter circuit that couples the first channel line to the second receiver.

Serial No.: 09/851,277 Filed: May 8, 2001

6. (Original) The memory interface system of Claim 2, wherein the first and second transmitters respectively comprise first and second open-drain MOS transistors.

- 7. (Original) The memory interface system of Claim 2, wherein the first and second receivers respectively comprise first and second differential amplifier circuits.
- 8. (Original) The memory interface system of Claim 7, wherein the first differential amplifier circuit is responsive to a first reference voltage and a data signal carried on the second channel line, and wherein the second differential amplifier circuit is responsive to a second reference voltage and a data signal carried on the first channel line.
- (Original) The memory interface system of Claim 7, further comprising:
  a first level shifter circuit that couples the second channel line to the first differential
  amplifier circuit; and

a second level shifter circuit that couples the first channel line to the second differential amplifier circuit.

- 10. (Original) The memory interface system of Claim 1, wherein a magnitude of the terminal voltage is greater than magnitudes of the memory supply voltage and the controller supply voltage, respectively.
  - 11. (Original) A data processing system, comprising:
  - a memory that is responsive to a memory supply voltage;
  - a memory controller that is responsive to a memory controller supply voltage; and

at least one channel line that couples the memory to the memory controller, the at least one channel line being responsive to a terminal voltage that is independent of the memory supply voltage and the memory controller supply voltage.

- 12. (Original) The data processing system of Claim 11, wherein the memory comprises a first transmitter and a first receiver, the memory controller comprises a second transmitter and a second receiver, and the at least one channel line comprises a first channel line that couples the first transmitter to the second receiver and a second channel line that couples the second transmitter to the first receiver.
- 13. (Original) The data processing system of Claim 12, wherein the first and second receivers are powered by the memory supply voltage and the memory controller supply voltage, respectively.
- 14. (Original) The data processing system of Claim 13, wherein the first and second transmitters are operable independent from the memory supply voltage and the memory controller supply voltage, respectively.
- 15. (Original) The data processing system of Claim 12, further comprising: a first level shifter circuit that couples the second channel line to the first receiver; and a second level shifter circuit that couples the first channel line to the second receiver.
- 16. (Original) The data processing system of Claim 12, wherein the first and second transmitters respectively comprise first and second open-drain MOS transistors.

Serial No.: 09/851,277 Filed: May 8, 2001

- 17. (Original) The data processing system of Claim 12, wherein the first and second receivers respectively comprise first and second differential amplifier circuits.
- 18. (Original) The data processing system of Claim 17, wherein the first differential amplifier circuit is responsive to a first reference voltage and a data signal carried on the second channel line, and wherein the second differential amplifier circuit is responsive to a second reference voltage and a data signal carried on the first channel line.
- 19. (Original) The data processing system of Claim 17, further comprising: a first level shifter circuit that couples the second channel line to the first differential amplifier circuit; and

a second level shifter circuit that couples the first channel line to the second differential amplifier circuit.

- 20. (Original) The data processing system of Claim 11, wherein a magnitude of the terminal voltage is greater than magnitudes of the memory supply voltage and the controller supply voltage, respectively.
  - 21. 24. (Canceled)
